DELL × NVIDIA AI HACKATHON

Nightdesk

The support agent that works the night shift. On your own hardware.

Always-on · local inference only · Telegram & Slack · Paras & Harshita Adlakha

THE PROBLEM

24/7 products, 9-to-5 support teams

2am

The urgent email waits

A production outage sits under newsletters and password resets until someone logs in.

1 hour

SLAs don’t sleep

Enterprise contracts promise P1 responses within the hour, at any hour.

“Cancel”

Churn hides in the inbox

And cloud AI help desks mean sending every customer email to someone else’s model.

WHAT IT DOES

An agent that triages overnight and wakes a human only when it should

THE AGENT LOOP

The local model picks the tools. The code decides what each tool may do.

TOOL	DOES	GUARDRAIL
lookup_customer	Plan, MRR, renewal, SLA from the local CRM	Read-only
search_kb	Finds the policy that applies	Read-only, local files
classify	Category, urgency, one-line summary	Enums; invalid is rejected
draft_reply	Writes a grounded reply	Saved for approval; cannot send
escalate	Pages Telegram / Slack now	Only after P1 or churn risk
create_task · **finish**	Follow-ups for billing, sales, account managers	Max 8 steps, then fallback

ONE NIGHT, SIX EMAILS

Every email gets the right response, and nobody is woken for spam

EMAIL	DECISION	ACTION
Harbor Logistics: warehouse scanners down, 503	P1 · outage	Paged on-call, holding reply drafted
Corvid Health: “we want to cancel”	churn risk	Paged, account-manager task, apology
Studio Finch: charged twice	billing	Policy-grounded reply, billing task
Brightlane: SSO + 12 seats	sales	Answer + sales lead
Tandem Cafe: locked out	access	Self-serve unlock steps
“10x your MRR” newsletter	spam	Archived. No reply, no alert

LOCAL-FIRST, BY CONSTRUCTION

Customer email never touches a cloud model

- Model endpoint must be **localhost**, or the code refuses to call it (unit-tested)
- CRM, knowledge base, state and audit log are local files
- $0 per model call; cloud LLM calls: **0**
- Model down or out of memory? A rule engine runs the same tools
- Built for the Dell Pro Max GB10: 128 GB unified memory, on 24/7

```
$ ollama pull qwen2.5:32b

$ npm start

model: qwen2.5 @ localhost:11434 (local)
channels: telegram, console

$ systemctl enable --now nightdesk
```

WHY A COMPANY PAYS

A night shift for the cost of one box in the closet

SLA protection

P1s are paged in minutes, not discovered at 9am.

Revenue saved

Churn signals reach the account manager with MRR and renewal date attached.

Mornings back

Replies drafted from your own policies; the team approves instead of writing.

Compliance-friendly

No third-party model sees customer data. Every action is in an audit log.

NEXT

Two-way chat, real mailboxes, local embeddings

Approve drafts from Telegram (“approve 3”), connect IMAP/Gmail, semantic knowledge-base search on the GB10, and run inside an OpenShell sandbox.
